# LONGITUDINAL DATA ANALYSIS 

## Homework I, 2005

SOLUTION

1. Suppose A and B are both $2 \times 2$ matrices with

$$
\mathbf{A}=\left(\begin{array}{cc}
6 & 3 \\
-2 & 5
\end{array}\right), \mathbf{B}=\left(\begin{array}{cc}
-4 & 10 \\
7 & 6
\end{array}\right)
$$

(a) Verify that $|\mathbf{A}||\mathbf{B}|=|\mathbf{A B}|$.

$$
|\mathrm{A}|=6 \times 5-3 \times(-2)=36 ;|\mathrm{B}|=(-4) \times 6-10 \times 7=-94 .
$$

Therefore $|\mathrm{A}||\mathrm{B}|=36 \times(-94)=-3384$.

$$
\mathrm{AB}=\left(\begin{array}{cc}
6 & 3 \\
-2 & 5
\end{array}\right)\left(\begin{array}{cc}
-4 & 10 \\
7 & 6
\end{array}\right)=\left(\begin{array}{cc}
-3 & 78 \\
43 & 10
\end{array}\right)
$$

So, $|\mathrm{AB}|=(-3) \times 10-78 \times 43=-3384=|\mathrm{A}||\mathrm{B}|$
(b) Verify that $|\mathbf{A}|=1 /\left|\mathbf{A}^{-1}\right|$.

$$
\mathrm{A}^{-1}=\frac{1}{36}\left(\begin{array}{cc}
5 & -3 \\
2 & 6
\end{array}\right) .
$$

Therefore, $\left|\mathrm{A}^{-1}\right|=\frac{5}{36} \cdot \frac{6}{36}-\left(-\frac{3}{36}\right) \frac{2}{36}=1 / 36=|\mathrm{A}|^{-1}$
(c) Verify that $\operatorname{tr}(\mathrm{AB})=\operatorname{tr}(\mathrm{BA})$.

$$
\begin{aligned}
& \mathrm{AB}=\left(\begin{array}{cc}
-3 & 78 \\
43 & 10
\end{array}\right), \operatorname{tr}(\mathrm{AB})=-3+10=7 \\
& \mathrm{BA}=\left(\begin{array}{cc}
-44 & 38 \\
30 & 51
\end{array}\right), \operatorname{tr}(\mathrm{BA})=-44+51=7 \\
& \text { So, } \operatorname{tr}(\mathrm{AB})=\operatorname{tr}(\mathrm{BA}) .
\end{aligned}
$$

2. Suppose that $a_{1}$ and $a_{2}$ are constants, and $y_{1}$ and $y_{2}$ are (possibly correlated) random variables with means $\mu_{1}$ and $\mu_{2}$ respectively. Show that $\operatorname{cov}\left(a_{1} y_{1}, a_{2} y_{2}\right)=$ $a_{1} a_{2} \operatorname{cov}\left(y_{1}, y_{2}\right)$ by using the definition of covariance.

Proof By the definition of covariance:

$$
\begin{aligned}
\operatorname{cov}\left(a_{1} y_{1}, a_{2} y_{2}\right) & =E\left(\left(a_{1} y_{1}-a_{1} \mu_{1}\right)\left(a_{2} y_{2}-a_{2} \mu_{2}\right)\right) \\
& =a_{1} a_{1} E\left(\left(y_{1}-\mu_{1}\right)\left(y_{2}-\mu_{2}\right)\right) \\
& =a_{1} a_{2} \operatorname{cov}\left(y_{1}, y_{2}\right)
\end{aligned}
$$

## 3 Exploratory Data Analysis

(a) read data from back.raw

```
. clear
. set memory 40m
(40960k)
set matsize 800
*log using c:\data\midterm.log, replace
    infile id group pnvrs1 pnvas1 anvas1 alvas1 time1 pnvrs2 pnvas2 anvas2
alvas2 time2 pnvrs3 pnvas3 anvas3 alvas3 time3 pnvrs4 pnvas4 anvas4 alvas4
time4 using c:\data\back.raw
(27 observations read)
. *reshape to the long format
. reshape long pnvrs pnvas anvas alvas time, i(id) j(set)
(note: j = 1 2 3 4)
\begin{tabular}{|c|c|c|c|}

. *convert to cross-sectional time-series data

```
tsset id time
    panel variable: id, 1 to 27
    time variable: time, 25 to 890, but with gaps
. iis id
. tis time
```

(b) describe the data
. xtdes, patterns(0)

| id | 1, 2, ..., 27 | $\mathrm{n}=$ | 27 |
| :---: | :---: | :---: | :---: |
| time | 25, 42, ..., 890 | $\mathrm{T}=$ | 90 |
|  | $\text { Delta(time) }=1 ;(890-25)+1=866$ |  |  |
|  |  |  |  |

| Distribution of T_i: | min | $5 \%$ | $25 \%$ | $50 \%$ | $75 \%$ | $95 \%$ | max |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
|  | 4 | 4 | 4 | 4 | 4 | 4 | 4 |

There are 27 subjects in this dataset. The measurements are obtained at 90 different times since the treatment. The panel variable and the time variable can uniquely identify each observation. Each subject is tested 4 times. In this data, the time varying variables are time since treatment (in minutes) and the scores of the four test, pain VRS, pain VAS, anxiety VAS, and alertness VAS. The baseline variable is the treatment group, either intercostals/epidural analgesic (Group 1), or morphine infusion analgesic (Group 2). The data is balanced but not equally spaced.
(c) explore the anxiety VAS with respect to time and to treatment group. . sum pnvas anvas alvas

| Variable | Obs | Mean | Std. Dev. | Min | Max |
| :---: | :---: | :---: | :---: | :---: | :---: |
| pnvas | 106 | 29.0283 | 20.8379 | 0 | 86 |
| anvas | 104 | 26.46154 | 23.9534 | 0 | 99 |
| alvas | 105 | 54.86667 | 27.23405 | 2 | 97 |

```
. gen anvas1 = anvas if group == 1
(53 missing values generated)
. gen anvas2 = anvas if group == 2
(59 missing values generated)
. ksm anvas1 time, gen(sm1) lowess bw(0.8) nograph
. ksm anvas2 time, gen(sm2) lowess bw(0.8) nograph
. sort time
. graph anvas1 anvas2 sm1 sm2 time, c(..ll)s(oT.x) xlab ylab saving(c,replace)
```

The figure above shows the score of anxiety VAS in the two treatment groups across the time since treatment (in minutes). The open squares represent the scores of anxiety VAS in Group 1 intercostals/epidural analgesic), while the open triangles show the scores of anxiety VAS in Group 2 (morphine infusion analgesic). There are two smoothed lines showing the marginal tread to the scores of anxiety VAS across time in the figure. The top line represents the marginal trend for Group 1 while the bottom line for Group 2. In the beginning, both groups have similar scores of anxiety VAS. After that, it seems that the scores of anxiety VAS in Group 1are relatively stable over time. On the other hand, the scores of anxiety VAS in Group 2 decrease over time.

## (d) explore the correlation structure.

```
: xi: reg anvas i.group*time
```

i.group _Igroup_1-2 (naturally coded; _Igroup_1 omitted)
i.group*time _IgroXtime_\# (coded as above)

| within |  | 13.02375 | -34.83516 | 32.30041 | T-bar | 185 |
| corr. between |  | 17.95069 |  |  |  |  |
| corr. within |  | 15.06292 |  |  |  |  |

. variogram anvasres1, bw(0.8)
Computing smooth lowess model for $v$ in ulag

Variogram of anvasres1 (7 percent of v_ijk's excluded)

The figure above shows the variogram after removing the time and treatment group effects. It is clear that the variogram does not monotonically increase over time lag. We can notice that the time lag is highly clustered. Therefore we can group time using hour as the unit for the time since treatment instead of using minute.
. gen time2hrs = round(time/60,1)
(1 missing value generated)
. tab time2hrs set

|  | set |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| time2hrs | 1 | 2 | 3 | 4 |  |
| 0 | 1 | 0 | 0 | 0 | 1 |
| 1 | 17 | 0 | 0 | $\bigcirc$ | 17 |
| 2 | 6 | 0 | 0 | 0 | 6 |
| 3 | 1 | 0 | 0 | 0 | 1 |
| 4 | 1 | 1 | 0 | 0 | 2 |
| 5 | 1 | 15 | 0 | 0 | 16 |
| 6 | 0 | 8 | 0 | 0 | 8 |
| 7 | 0 | 2 | 0 | 0 | 2 |
| 8 | 0 | 0 | 1 | $\bigcirc$ | 1 |
| 9 | 0 | 0 | 19 | 0 | 19 |
| 10 | 0 | 0 | 5 | $\bigcirc$ | 5 |
| 11 | 0 | 0 | 2 | 0 | 2 |
| 12 | 0 | 0 | 0 | 5 | 5 |
| 13 | 0 | 0 | 0 | 13 | 13 |
| 14 | 0 | 0 | 0 | 7 | 7 |
| 15 | 0 | 0 | 0 | 2 | 2 |
| Total | 27 | 26 | 27 | 27 | 107 |

From the table above, the time since treatment is clustered at 1, 5, 9 and 13 hours. Also it is highly related to the variable "set" (the correlation between time2hrs and set is 0.9830 which can be shown using "corr time2hrs set" in STATA). Thus we can use set as the time variable in variogram.
. tis set
. sort group set
. by group set: egen anvasmn = mean(anvas)

```
. gen anvasres2 = anvas - anvasmn
(4 missing values generated)
. xtsumcorr anvasres2
\begin{tabular}{|c|c|c|c|c|c|}
\hline Variable & Mean & Std. Dev. & Min & Max & Observations \\
\hline anvasr~2 overall & -9.17e-08 & 23.33507 & -33.15385 & 69 & \(\mathrm{N}=104\) \\
\hline between & & 19.62466 & -30.46703 & 56.53297 & \(\mathrm{n}=127\) \\
\hline within & & 12.85709 & -34.06868 & 32.78846 & T-bar \(=3.85185\) \\
\hline corr. between & & 17.98343 & & & \\
\hline corr. within & & 14.87017 & & & \\
\hline rho & & . 5939 (b & tw. fract & f total) & \\
\hline
\end{tabular}
. variogram anvasres2, discrete
Computing ANOVA model for v in ulag
Variogram of anvasres2 ( 9 percent of v_ijk's excluded)
```

```
The overall variance is \(23.335^{2}=544.22\). From the variogram, the betweensubject "trait" variance is less than 200. The variogram is almost flat, suggesting that after removing the time and treatment effect, uniform correlation might be reasonable.
```

## 4 Confirmatory Data Analysis

(a)

The scientific purpose of the study is to compare two treatments (either intercostals/epidural analgesic, group 1, or morphine infusion analgesic, group 2) with respect to alertness. Since rating scores of alertness were obtained at different time since treatment, a model of alertness with treatment group, time, and their interaction may capture the scientific goal. The model is

$$
E\left(\text { alvas }_{i j}\right)=\beta_{0}+\beta_{1} \text { group }_{i}+\beta_{2} \text { time }_{i j}+\beta_{3} \text { group }_{i} * \text { time }_{i j}
$$

where alvas is the rating score of alertness, group is treatment group indicator, time is the test time since treatment (in minutes), and $\beta \mathrm{s}$ are coefficients.
(b)

```
xi.reg alvas i.group*time
i.group _Igroup_1-2 (naturally coded; _Igroup_1 omitted)
i.group*time _IgroXtime_# (coded as above)
```

|  | rho |  | . 2925 (b | tw. fract. | of total) |  |

[^0]Variogram of alvasres (14 percent of v _ijk's excluded)

The variogram of alvas (alertness) is shown above. The total variance is $24.111^{2}=581.34$. The between-subject "trait" variance and the measurement error variance are quite small.
(d)

The variogram of alvas shown in (c) suggests an exponential model for the correlation structure. The variogram increases monotonically with time lag, and saturates at a level very close to the total variance, a typical variogram pattern for an exponential correlation model.

[^0]:    variogram alvasres, bw(0.8)
    Computing smooth lowess model for $v$ in ulag
