Master’s-Level Biostatistician Position at UCSF

I am looking to build on our NIH-funded program in clinical and translational research in the fields of cardiovascular and metabolic disease, and to expand research activities in advanced cardiovascular imaging, genomics and other omics areas, and phenomics using big data from electronic health systems at the San Francisco VA's Cardiology Section. There would be an opportunity to work with clinician-scientists, epidemiologists, and PhD-level biostatisticians both within Cardiology, and also through interdisciplinary collaborations with established clinical research programs at the San Francisco VA in General Medicine, Nephrology, and Infectious Disease.

We would prefer someone with research experience, but are also open to new graduates. We are seeking an individual with skills in cross-sectional and longitudinal data analysis including repeated measures, as well as skills or interest in statistical genetics.

Many thanks,

Jorge Kizer (jorge.kizer@einstein.yu.edu)
