

Bioinformatics

Some selected examples . . . and a bit of an overview

Ingo Ruczinski

Wikipedia:

Bioinformatics and computational biology involve the use of techniques including applied mathematics, informatics, statistics, computer science, artificial intelligence, chemistry, and biochemistry to solve biological problems usually on the molecular level.

...

Major research efforts in the field include sequence alignment, gene finding, genome assembly, protein structure alignment, protein structure prediction, prediction of gene expression and protein-protein interactions, and the modeling of evolution.

Wikipedia:

*The terms **bioinformatics** and **computational biology** are often used interchangeably. However **bioinformatics** more properly refers to the creation and advancement of algorithms, computational and statistical techniques, and theory to solve formal and practical problems inspired from the management and analysis of biological data.*

***Computational biology**, on the other hand, refers to hypothesis-driven investigation of a specific biological problem using computers, carried out with experimental or simulated data, with the primary goal of discovery and the advancement of biological knowledge.*

NIH definition of Bioinformatics and Computational Biology:

Bioinformatics and computational biology are rooted in life sciences as well as computer and information sciences and technologies. Both of these interdisciplinary approaches draw from specific disciplines such as mathematics, physics, computer science and engineering, biology, and behavioral science.

...

Bioinformatics applies principles of information sciences and technologies to make the vast, diverse, and complex life sciences data more understandable and useful. Computational biology uses mathematical and computational approaches to address theoretical and experimental questions in biology. Although bioinformatics and computational biology are distinct, there is also significant overlap and activity at their interface.

NIH definition of Bioinformatics and Computational Biology:

The NIH Biomedical Information Science and Technology Initiative Consortium agreed on the following definitions of bioinformatics and computational biology recognizing that no definition could completely eliminate overlap with other activities or preclude variations in interpretation by different individuals and organizations.

Bioinformatics: *Research, development, or application of computational tools and approaches for expanding the use of biological, medical, behavioral or health data, including those to acquire, store, organize, archive, analyze, or visualize such data.*

Computational Biology: *The development and application of data-analytical and theoretical methods, mathematical modeling and computational simulation techniques to the study of biological, behavioral, and social systems.*

The central dogma of biology

Drawn by Ebbe Sloth Andersen <http://old.mb.au.dk/>

DNA → RNA → Protein

DNA Sequence analysis, genome annotation, evolutionary biology, phylogeny, DNA alterations, comparative genomics, SNP association studies

RNA Analysis of gene expression and regulation

Proteins Analysis of protein expression, protein-protein docking, prediction of protein structure

Systems Biology:
modeling biological systems, gene/protein networks

Some selected examples

- 1 Chromosomal alterations
- 2 Protein structure prediction
- 3 2D gel electrophoresis

```

1 By SNP:

Estimate genotype and copy number for each SNP.

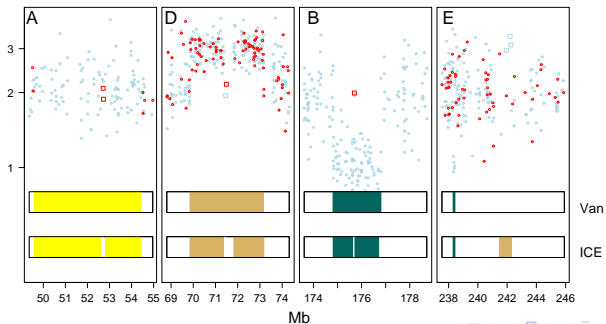

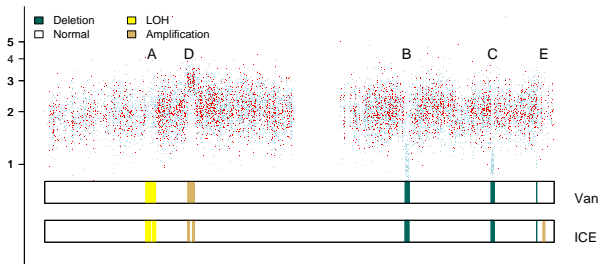

2 Within a sample:

Borrow strength between SNPs to infer regions of LOH and copy number changes.

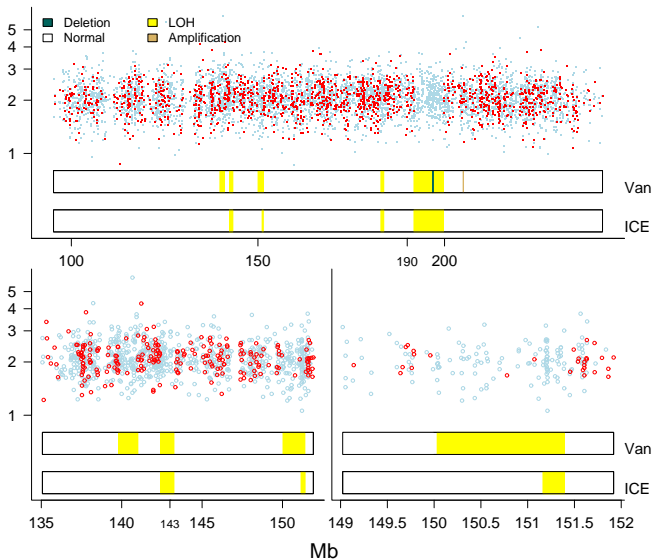

3 Between samples:

Comparison between normal and disease populations to find chromosomal alterations associated with disease.
