Assessing Micronutrient Deficiencies Through The Plasma Nutriproteome

Ruczinski, West, Cole, et al

## Background

- Micronutrient deficiencies remain a complex and “hidden” aspect of malnutrition worldwide.
- Timely and thorough estimation of the prevalence of multiple micronutrient deficiencies is hampered by dependence on complex, time and resource-intensive laboratory indicators of nutritional status.
- We are seeking to establish the validity of a “plasma nutriproteome” that could be used as a basis for developing tests to assess multiple micronutrient deficiencies in populations on a single methodological platform.

Funding provided by the Bill and Melinda Gates Foundation (#5241).

Assessing Micronutrient Deficiencies Through The Plasma Nutriproteome

Ruczinski, West, Cole, et al

## Project overview

- Using 8plex iTRAQ based proteomics, we are identifying plasma proteins that covary with conventional plasma indicators of micronutrient status.
- Plasma samples collected and archived from 1000 Nepalese children, 6-9 years of age, were selected for comprehensive nutritional analyses.
- Pooled plasma proteome analyses have identified 730 unique plasma proteins (FDR of%), 491 of which have been detected to date in individual specimens (n=49 to date, n=500 anticipated by summer 2011).
- Biostatistical methods are developed to quantify the relative protein abundance in the samples, and to detect a protein signature predictive of indicators of micronutrient status.

## Micronutrient measurements

Assessing Micronutrient Deficiencies Through The Plasma Nutriproteome

Ruczinski, West, Cole, et al

## Reporter ion intensities

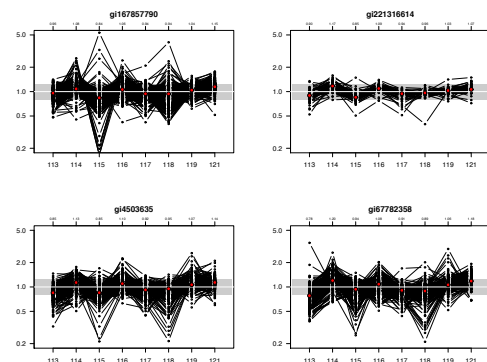

Run with 8 technical replicates of a master pool

Assessing Micronutrient Deficiencies Through The Plasma Nutriproteome

Ruczinski, West, Cole, et al

## Log reporter ion intensities (median polish)

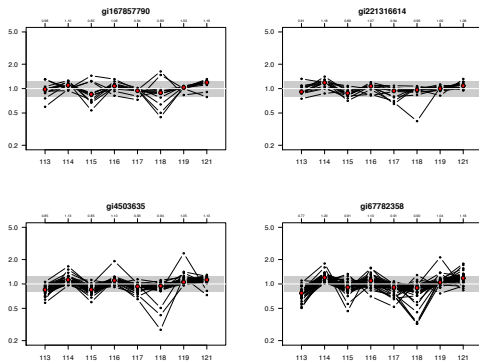

Run with 8 technical replicates of a master pool

Assessing Micronutrient Deficiencies Through The Plasma Nutriproteome

Ruczinski, West, Cole, et al

## Log reporter ion intensities (median polish, by peptide)

Run with 8 technical replicates of a master pool

## Estimated relative protein abundance

Run with 8 technical replicates of a master pool

## Preliminary results

→ Some proteins covary with indicators of micronutrient status.

## Preliminary results

→ Combining measurements from multiple proteins improves the prediction.

## Summary

- Based on preliminary analyses with respect to vitamin A (in a small sample), a few plausible proteins explain ~90% of the variance in plasma retinol, and thus, an interpretable and predictive plasma nutriproteome is likely to exist.
- With assays fully operational, we anticipate a year of discovery, interpretation and reporting as nutritional and proteomics databases continue to grow and are analyzed.
- Analytical tools are developed using the open source environment R (<http://cran.r-project.org/>), and will be made publicly available via the Bioconductor repository (<http://www.bioconductor.org/>).
